

Writing DataFrames to Excel with x1sxwriter

Add any columns, sort the rows, etc. before sending it to Excel

pandas has another way to write to Excel, but with limited capabilities. We will prepare the handoff to xlsxwriter like this:

writer = pd.ExcelWriter('workbo ok-name.xlsx', engine='xlsxwriter')

Export the data just like any other DataFrame:

df.to excel(writer, sheet name='Sheet1')

Create the workbook and worksheet object names so you can operate on them with xlsxwriter:

workbook = writer.book worksheet = writer.sheets['She et1']

formatting your

Add cell formats, insert charts, etc., etc....
